MINES CONTENT MANAGEMENT SYSTEM

WORKING WITH HYPERLINKS

The Mines Content Management System (CMS) is a web-based application that allows web site owners and administrators to update pages, add images, and upload documents without any prior web development experience. This tutorial explains how to use the CMS to create and edit links from one web page to another.

For the purposes of this tutorial, the terms URL, web address, and address will be used interchangeably. These terms all refer to the location of a web page (or resource) revealed in a web browser’s address field (shown below).

![Web browser showing URL in address bar](image)

A web page’s URL is displayed in the browser’s address bar. The URL in the example above is “http://inside.mines.edu/administrative_departments.”

HYPERLINK BASICS

CMS users can easily create links to other web pages by using the “Insert/Edit Link” function in the CMS Editor. In order to create a link, you need to know two things:

- The name of the CMS page you are linking from
- The web address of the destination page

Note that the destination page may be another Inside.Mines page, a Mines page under another virtual host (like http://library.mines.edu), or an offsite resource like http://google.com or http://cnn.com.
To begin, log in to the CMS and use the directory tree to navigate to your site’s home directory. Locate the page you would like to create a link on, check it out, and open the page in the CMS editor.

This tutorial assumes that you have an understanding of basic CMS operation and concepts. If you do not have a CMS account, don’t know how to navigate to your work area, check out pages, or approve changes, refer to the Content Management Basics tutorial.

Log in to the CMS, navigate to your department’s folder, find the page you’d like to add a document link to, check it out, and open it in the CMS editor. In this example, we’ll be working on the Research department’s Technology Transfer page.

CREATING THE LINK

Use your mouse to select the content text you’d like to link, and click the “Insert/Edit Link” icon in the WYSIWYG toolbar to launch the Link box.

The Link box allows you to specify information about the hyperlink you’re creating. You can change the target, indicate a CSS class, etc. Most importantly, the Link box asks you for a URL.

To link the “contact us” text to the Research department’s Contact Us page, simply type the URL of the Contact Us page into the URL field. If you
have the destination page open in another browser tab, you can copy it from the address bar and paste it directly into the URL field.

Click the “OK” button in the Link box to complete the process. Preview, save, and approve the page as normal. Be sure to check the link in a browser to ensure that it is working correctly.

RELATIVE URLS VS. FULLY-QUALIFIED URLS

If you are creating a link to a non-Mines web page or document, you must supply the full address in order for the link to work. For example, a link to a specific page on CNN’s web site might look like this: http://www.cnn.com/2009/US/11/10/fort.hood.fire.chief/index.html. If you enter that address into the Link box’s URL field, the resulting hyperlink will take you to the correct page on CNN’s web site.

If, on the other hand, you are linking to one of your own pages, you don’t need to provide a fully qualified URL. Instead, you can enter a relative URL. Continuing the example above, the fully qualified address for the Research department’s Contact Us page is http://research.mines.edu/RES-Contact-Us. If you enter that address into the URL field, the link will work, but it is considered good practice to supply a relative URL for links that refer to your own pages. In this case, the relative URL is “/RES-Contact-Us” (note that the beginning “/” character must be included).

In short, you should use relative URLs to create links to pages that you own, and fully-qualified URLs in all other cases.

LINKING TO CMS PAGES

Creating a link is easy if you know the destination address, but what if you don’t? In many cases, when CMS users create a new page there is no obvious way to determine the URL, and no click path to get to the page through the live web site.
The CMS provides an easy way to find the URL of any page in the system. Navigate to the parent directory of any page you have access to. In the “Pages Currently Online” bin, click the information icon next to any page and an overlay containing the page’s relative URL will appear. You can copy the URL from the overlay and use it to create links to that page.

Click the information icon next to any page listed in the “Pages Currently Online” bin to reveal its URL.

CREATING MAILTO LINKS

The CMS allows users to create links to email addresses. These types of links automatically open an email client when clicked, and supply the email address specified in the link. To create a mailto link, run through the normal link creation process described above. When the Link box appears, switch the Link Type select box to “E-Mail” and supply an email address in the E-Mail Address field. Click the “OK” button, preview the page, save, and approve.
STEP BY STEP: CREATING HYPERLINKS

Start to finish, this is the procedure used to edit a web page in the CMS. Note that these steps assume you have not already logged in to the CMS, and have no pages currently checked out.

1. Log in to the CMS, navigate to your site's directory, check out the page you'd like to create the document link on, and open the page in the CMS editor.
2. Select the text you'd like to link to the document.
3. Click the Insert/Edit Link button (it looks like a globe with a chain in front of it). This should launch the Link box.
4. In the Link box, type or paste the URL of the destination page.
5. Click the "OK" button in the Link box to complete the procedure.
6. Preview and save the page as normal. Be sure to check the link outside of the CMS to ensure that it is functioning correctly.

That's it. Always remember to check the modified page in a browser to ensure the changes are live and correct.
